

Individual reflection, final - Carl Lundborg

The project is now finished and we have had our presentation of the application. I feel that I have learned a lot of how to work in a group, and especially the application of scrum. During the final sprint we realized that our scope for the different user stories and tasks were too big. We decided to correct this during the final sprint which resulted in a much more productive and effective sprint. For a future project I would like to take this into account and be better at breaking down problems into manageable tasks. What we also realized during the final sprint was that we had been thinking too much in technical terms and not so much in terms of what the customer would want and be able to describe. This is also something I would like to learn to be better at during future projects. This would be achieved by ignoring the technical terms during the creation of the use cases and only listen to what the customer would have in mind.

During my work with the team I realized quickly that I knew some concepts that were new to most of them. I used this knowledge to take on tasks that I felt I could manage in the beginning and that would also serve as something I could learn the others later on how to implement in their own work. For future projects I would like to take on more new challenges that I can put myself into and in that way both evolve in my own knowledge and also use this knowledge to teach the rest of the team about it.

My contribution to the team's application of scrum have been a bit of everything. I have come up with use cases, breaking them down into tasks, taken on a variety of different tasks and learned the rest of the team about my implementations after completion of some tasks in order to make it easier for the others to merge their tasks in the project. For future projects I would like to be more specific in my contribution in order to be more productive. Also by being better at coming up with use cases and breaking them down into manageable tasks would, based on my current experience improve the application of scrum significantly.

My contribution to the team's contribution have been like I mentioned before a bit of everything. I have chosen tasks where some were more connected to each other than others. For future projects I would like to be more specific in what tasks I take on in order to be more productive and do a better contribution to the team's deliveries. This could be done by choosing tasks that are more connected to the previous I have worked on in order to make it easier in finishing them and not have to study about new concepts every time I start a new task.
