

Individual reflection, week 2 - Carl Lundborg

We have now been fully introduced to Scrum and also what we are supposed to do during the project. My goals now is to learn how to apply scrum in real life. Also how the different tools work that we have been introduced to for the project. To learn this I need to apply the scrum work flow in what I and the group are working with and to continuously reflect upon what we are doing. Also I need to work some on my own in order to understand all the tools and systems so that I can work with what the project is demanding of us.

There are some members that are not so familiar with GitHub. By doing par-programming and showing new concepts I can learn the other members the basics. Also if someone is having trouble with for example the API I will try to understand it and in that case explain it.

We have decided that scrum masters can change if the current one doesn't want to anymore. If that is the case I am willing to take that role. Since we haven't started with the project yet my part is not yet decided. As a goal though, I will find my specifik role for the application of scrum. This will be reached by reflecting my own work and by actively engaging in the work of the group see where I belong.
