

Individual reflection, week 1 - Carl Lundborg

The current situation is that we have been introduced to the concept of Scrum and worked with it by doing a task involving building a Lego city.

I felt that Scrum is a very good tool to keep the group consistent with their work and producing something that is valuable to the customer. I would therefore like to learn more about the working structure within the team. How to break down a problem into manageable tasks and in doing so deliver something that has value and not slowing down the team. Also how to manage the communication with the customer and in so producing something that the customer is satisfied with.

I will learn this by actively engaging in the work of the others and by doing so seeing what the others have problems with. Ask questions and see so that everyone is familiar with the different aspects of the project and tools we are working with. Also use what I have already learned in a correct way in order to understand the critical parts that needs to be refined and the necessary steps to move past them.
