

## Individual reflection, week 3 - Carl Lundborg

We have now started on the project. The first sprint will be more of a "hello world" integration, where we learn the basics in order to start developing the application. My goal is not to be able to apply scrum for a real sprint and start working on tasks. To apply this I need to define a user case and to break it down into problems that are both manageable and doable.

Since we now have started looking at the code, I could try to learn the team about certain ways of structuring code, since some are not familiar with MVC for example. This could be achieved by making a task out of it.

Since we have just started working with the code our Scrum sprints are not fully developed yet. However my contribution will be to come up with user cases and breaking them down into manageable tasks. This will be achieved by actively meeting up with the group and discussing what we want to achieve.

Right now my contribution to the teams deliveries will be to learn how to work with the project. My goal is to take part in tasks and finish them in time. This will be achieved by breaking down the tasks and not setting the standards too high in the beginning so that there will be some kind of delivery at least.
