

Individual reflection, week 7 - Carl Lundborg

This was our final sprint. We sat with the customer and the teachers this week, which made us realize that for example our use cases were way to big. This can explain why it took so long for us to finish a task and therefore finish each use case. By rewriting the use cases we broke down the tasks into more manageable tasks. This resulted in me finishing two tasks this week instead of one that I had done previous weeks. For future projects where scrum is needed I would like to learn more how to not look at a use case from the technical point of view, but to see it from a customers point of view in order to make more manageable use cases. To get there I will use my current knowledge of applying scrum.

I have worked with the others and merged the last part of the tasks. I continued to show them some of my implementations but most of it they already knew by now. Next time I will be working with scrum I will teach the other team members all that I know of how to use it. This will be done by using the experience gathered from working with this project.

This week my contribution to scrum have been to make new use cases and break them down into even smaller and more manageable tasks than I had done before. In future projects my contribution would be to use my current knowledge in order to produce better use cases and tasks from these.

My contribution to the teams deliveries have been the same as last week. I have continued my work with tasks that I have finished in order to finish use cases and meet the KPI criteria. By rewriting the use cases this week we came up with better tasks that provided customer value and improved the work flow. Also here I would like to use my experience for future projects to be able to perform better with the team deliveries, by coming up with better tasks that can each provide some kind of costumer value in the end.
