

Individual reflection, week 4 - Carl Lundborg

This week we have started a real sprint by building cases and breaking them down into manageable tasks. My task was to make a skelett for the code by implementing some form of MVC pattern. The task took longer than expected though and I am still working on a solution. What I like to learn better for next week is to estimate the time better for each task, but also learn to break down tasks even more so that I don't set the bar too high. By continuing my task and take on new ones the learning process of this will probably come naturally.

I will continue on my task and when enough progress has been made, I will show it to the rest of the team in order to learn them about my implementation and hopefully make the work easier for everyone. This will be achieved by actively showing my progress and commit my changes to the master branch.

My contribution to scrum now has been to come up with user cases and breaking them down into manageable tasks. I will continue this contribution and my goal is to make better tasks that are more concrete, and also be better at estimating the time for each task. This will be achieved by actively contributing to the scrum board and by working with tasks, learn to evaluate their complexity.

My contribution to the teams deliveries will continue to be the same as the goal I had for last week. I will try to take on tasks that do not interfere with the production of the other team members work and finish the tasks that I have taken on in time. If the tasks will not be completed in time, I will take this into consideration when estimating new tasks. I will also achieve this goal by always try to deliver something even if its not exactly as the task was set to be, so that there will always be something to show the customer.
